

The whole forecast on one screen.

Summary, hourly and daily, with no scrolling down — everything scrolls sideways. Tap any hour or day for a chart, or drill into a summary line.

Tap an hour or a day.

That day's temperature and feels-like, a cursor that reads the exact hour, and the rain underneath.

Tap the moon.

The real lunar surface, lit and tilted for any hour you scrub to – here, three days back. Then tap Find the Moon and the phone points you at it.

Daylight through the year.

A full year on one screen. The brighter band is the vitamin D window. On October 8th at 51°N it already reads “none today”.

Wind and gusts, hour by hour.

Light to severe, arrows pointing the way it blows, and a readout for any hour you drag to.

Air quality, explained.

Canada's AQHI here, the US AQI elsewhere — where your reading sits on the scale, and the pollutants behind it.

Live radar you can rewind.

Drag back through the last few hours, or forward into what's coming. Tap anywhere on the map and drop a pin — the whole forecast moves to that exact spot.

Free. No ads. No account.

Add it to your home screen and it runs like an app: full screen, no address bar, and it works offline from the last forecast.

Forecast by Open-Meteo, radar by RainViewer. No keys, no tracking, no sign-in – and nothing to buy, ever.
