Five statistics tools for well data, in your browser.

Probit plots, multivariate analysis, type-well curves, sequential accumulation and a sanity check for estimates. Bring a CSV — your data never leaves your computer.

Is it lognormal?

A cumulative probability plot from any column, on the axis that draws it straight. Group by any other column to see what pulls the wells apart.

What drives the result?

Every input ranked by how cleanly it separates the best wells from the rest. Feature importance and a correlation matrix on the next tabs.

The average well, month by month.

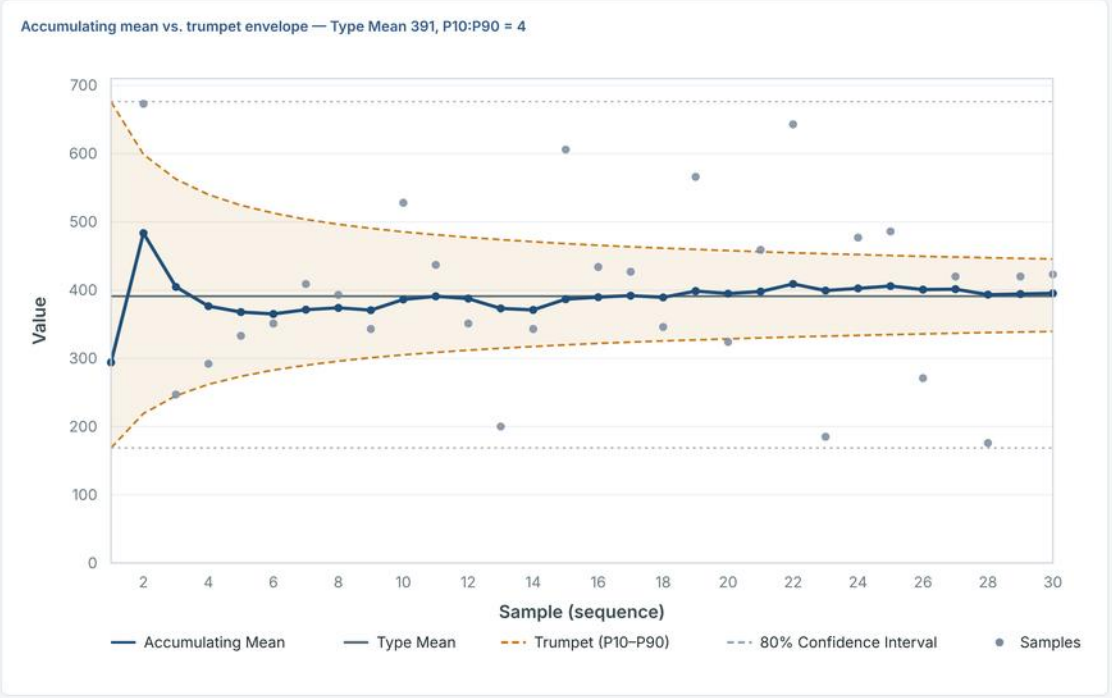

A type-well curve from real production: condensed, aligned and averaged, by area or operator, with each month's P10, P50 and P90.

Is the program settling?

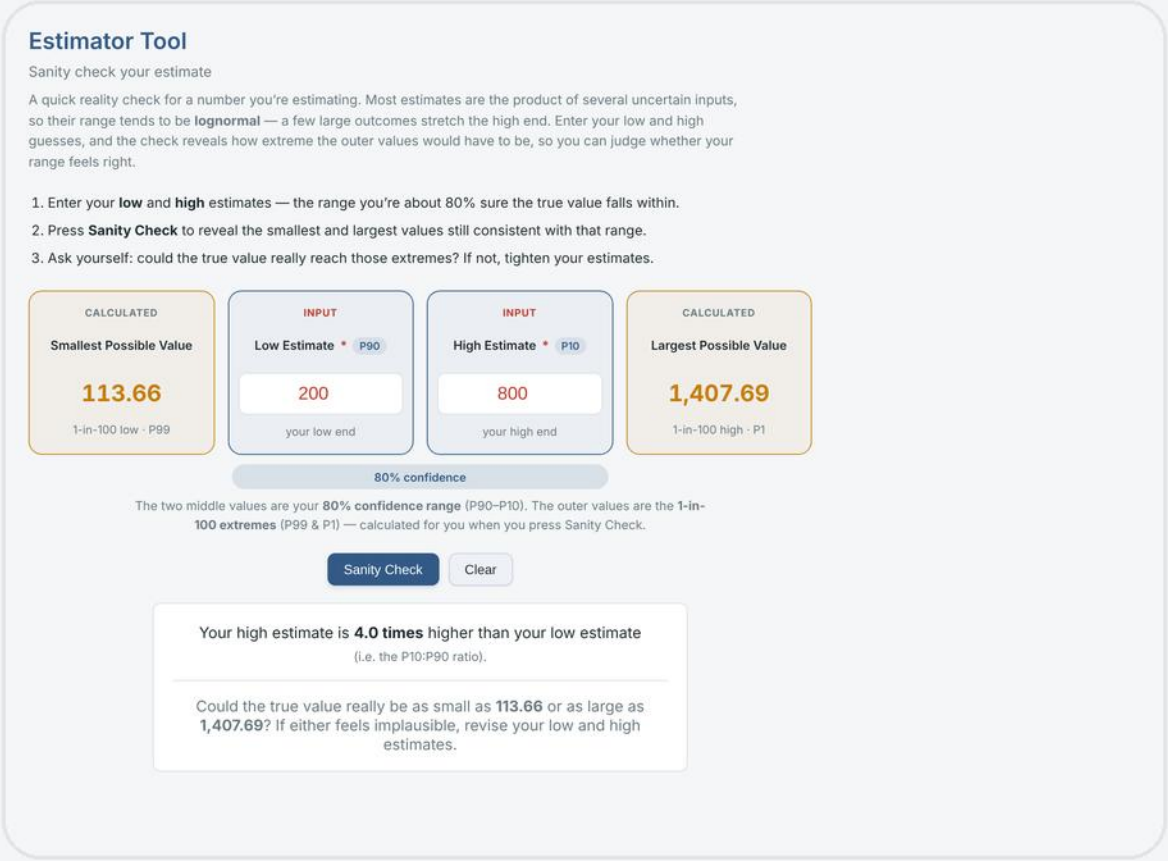

Wells in the order they were drilled. The running average against the trumpet the type mean implies, so you can see whether the program is on its curve.

Sequential Accumulation — Plot

A sanity check for any estimate.

Enter a low and a high. It shows the 1-in-100 extremes those two imply, so you can ask whether the true value could really reach them.

Free. No account. Nothing leaves your computer.

Built for the Type-Well Curve Fundamentals course at SAGA Wisdom, and useful well beyond it. Save a session as a file and pick it up where you left off, or hand it to a colleague.

Six short videos, one per tool, on the Shozbot YouTube channel. Start with the Overview.
