A statistics workbench for type-well curve work.

Probit Analysis, Multivariate Analysis, Type-well Curve, Sequential Accumulation and the Estimator Tool. CSV in, charts and tables out. Runs in the browser; the data stays on your computer.

Probit Analysis

Cumulative probability plots on log and linear axes, with the best fit and its R^2, the mean, its percentile location and the P10:P90 ratio. Group by any column to test what separates the distribution.

Multivariate Analysis

Parallel coordinate distributions and input optimization distributions, each input ranked by separation, eta squared: the share of its variance explained by target quartile. Feature importance and a correlation matrix complete the set.

Type-well Curve

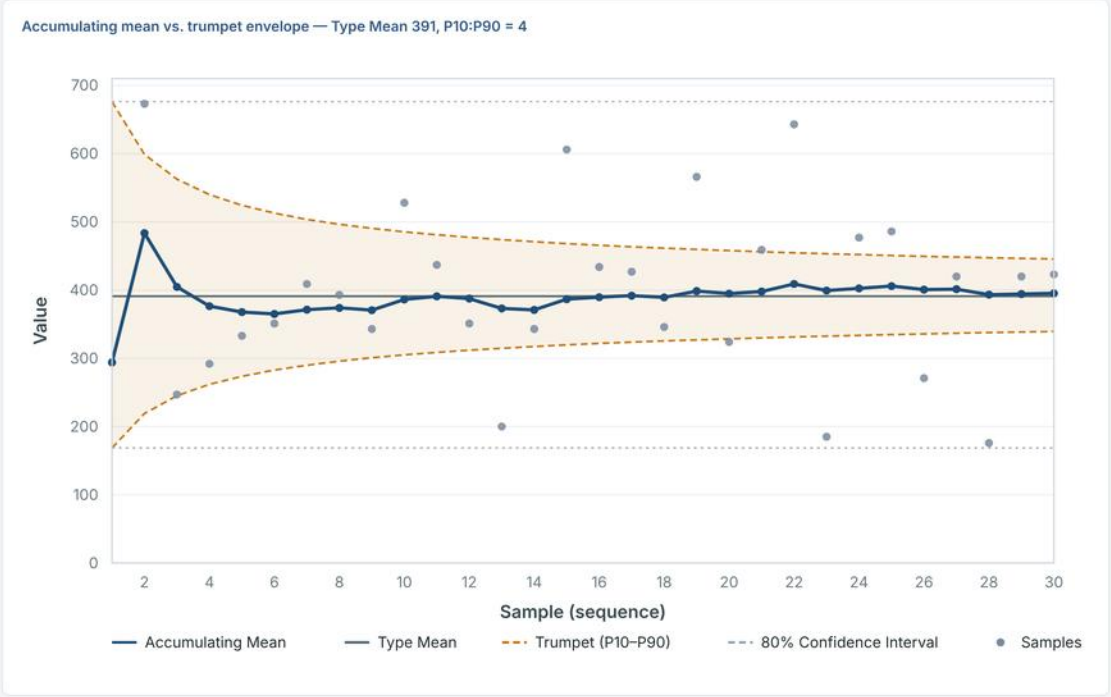

Average production profiles from monthly well history: condensed to producing months, aligned on first production or peak rate, as calendar-day rate or cumulative, with P10, P50, P90 and well count by month and by group.

Sequential Accumulation

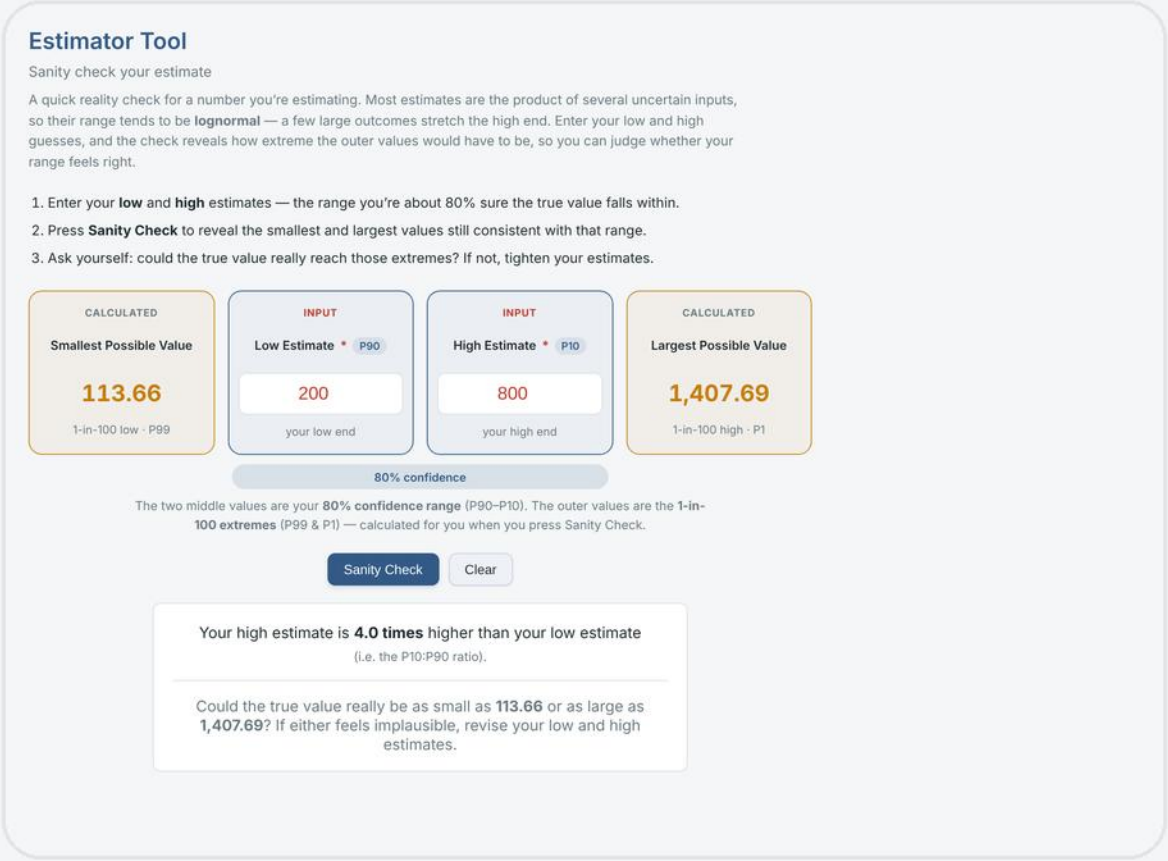

The accumulating mean of wells in drilling order against the trumpet envelope implied by the type mean and the P10:P90 ratio, with the 80% confidence interval.

Sequential Accumulation — Plot

Estimator Tool

A lognormal sanity check. From a P90 and a P10 estimate it returns the implied P99 and P1 and the P10:P90 ratio, so a range can be judged by the extremes it commits you to.

A free teaching tool for type-well curve work.

Companion to the Type-Well Curve Fundamentals course at SAGA Wisdom. Sessions save as files you own. No account, no upload: the data never leaves your computer.

Six short videos, one per tool, on the Shozbot YouTube channel.
